Connectivity without compromise

Data Backup

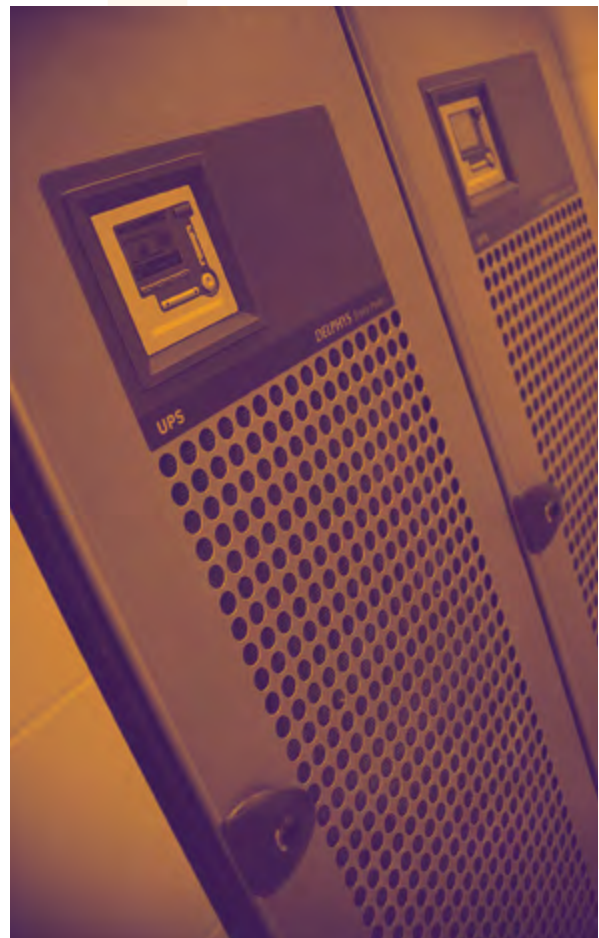

High speed threat protection

Our Enterprise solutions have powerful tools to enable robust and reliable backups of burgeoning Exchange email mailboxes and entire working databases.

The M24Seven backup technology provides CDP (continuous data protection) block level back up for your data, covering all standard operating systems, database backups and the ability to backup virtualised platforms, such as VMWare, Xenserver or Hyper V.

Product benefits and features

- **Multi-platform support** – the core technology supports physical and virtual servers
- **Block-level backups** – bypass the file system and read the data directly from the Disk or Volume. This means that you are able to run fast, performance-friendly backups regardless of the number of files you're trying to backup
- **Disk safe replication** – Disk Safe can be fully replicated for offsite storage without taking it offline giving users the freedom to conduct a replication without fear of losing data
- **Data retention policies** – define a replication goal (for example, every 15 minutes) and how many recovery points to retain. Old recovery points are automatically merged and their storage is recycled

Business benefits:

Minimising potential loss of data:

We store the data over our network in a secondary datacentre to minimise any potential loss of data. In the event of a partial or total loss of information, you can choose to restore individual files, folders or an entire server to any point in time quickly and easily and restore the data to any location required.

Ease of use:

Simple to use, giving you quick and easy web access to your archived files and allowing you a number of restore options that best suit your needs.

Secure:

We own and operate our own green and secure datacentres which are among the most green and efficient in Europe.
